

Are you, or someone you know, age 60 to 85 years?

We are researching an investigational medication in people who might be at increased risk for developing memory loss associated with Alzheimer's disease

Learn about the EARLY Trial

We are researching the safety and effectiveness of an investigational medication in people who might be at increased risk for developing memory loss associated with Alzheimer's disease. Currently there is no cure for Alzheimer's disease, and there are no treatments proven to delay early memory loss associated with Alzheimer's disease.

We are enrolling approximately 1650 volunteers to help us with this important research. The EARLY Trial will last for about 5 years and will involve regular visits to the trial site.

We are looking for people who have generally normal memory function in daily life, and who are not being treated for memory problems.

Are you able to help?

You may be able to take part in the EARLY Trial if you:

- n are age 60 to 85 years
 - If you are age 60 to 64 years, you will need to have at least one of the following:
 - a parent or sibling with Alzheimer's disease
 - been told you are at increased risk for developing Alzheimer's disease (that you have the apolipoprotein E [APOE] ε4 gene or a proven elevation of beta-amyloid in your brain).
- n have generally normal memory function in daily life
 - Even if you have noticed subtle memory changes, you may still be able to take part. The clinical trial doctor and the trial team will work with you to determine if this trial is right for you.
- n have a close friend, relative, or spouse who can come to some trial visits with you.

Please contact the trial team today for additional information if you think you, or someone you know, can help us with this important research.
