

About Us

Our expert staff from both Massachusetts General Hospital and Brigham and Women's Hospital work closely together under the MADRC umbrella, across several research sites, to lead cutting-edge research. We also provide both professional and community resources and education. Our goal is to find effective treatments and eventually a cure for Alzheimer's disease and related dementias.

Help Us End Brain Disease

Let's work together to end brain disease

You can help

Educate

Help us increase awareness about research opportunities and the importance of having diverse participants. Encourage your family, friends and community members to review our website and/or attend one of our informational events to learn more about brain health and our cutting-edge research advances.

Participate

Our center has research opportunities available for all people, whether they are cognitively healthy, have a diagnosis of Alzheimer's or related dementia, or are just concerned about their memory and thinking. Contact us to learn more.

Donate

You can help advance science by donating your brain. Research needs brains from those affected by diseases and those unaffected to compare. Without being able to make comparisons, scientists cannot advance their understanding of, and treatments for, brain diseases. Visit our website to learn more.

All are welcome

Participating in research may feel intimidating, but for many it also provides a sense of purpose, accomplishment, and pride.

Our Center is especially committed to having research study volunteers who are diverse in race, gender, ethnicity, age and identity. This diversity is critical to make sure treatments work for everyone.
